

# Working with Mobile Apps

## Connecting Mobile Apps to PowerSchool

After a user downloads the mobile app to their device, the app will need to point to the correct PowerSchool server to authenticate. The Parent and Student apps walk the user through an on-boarding process. Most users will enter a four-character code that is used to locate the PowerSchool server. If a user does not know their District Code, they can search for their district by district name or school name. They can also manually enter the PowerSchool server URL. In either case, the mobile apps will search for the district code via PowerSource and/or connect via the server if the mobile services are accessible.

### District Code

The district code is a four-character code that can be entered on the sign in screen to point the mobile apps to the PowerSchool mobile services. This code is auto generated when the PowerSchool server is registered with PowerSource. The district code should never change for your district. If PowerSchool registers with a new domain name, the district code will update to the new domain name.

Anytime the district code is updated, it will be validated with PowerSource. If a red X appears next to the code, the entry is invalid and the user will need to enter the correct district code.

District Code

If a green check appears, the district code is registered to a valid PowerSchool server.
